

Reflection

1. What did NumPy hide, and why learn the loop first?

`temps.mean()` hides the loop, the running total, the counter, and the division. Learning the loop version first showed me what the computer really does, so I can trust the result, find mistakes, and understand why NumPy is faster: it runs optimized code on the whole array instead of one Python step at a time.

2. One insight about Kigali's weather?

The weather cooled by about 4.4 °C from the first half (26.21 °C) to the second half (21.78 °C). All 9 unusually hot days were in September, and rainy and dry days had almost the same average temperature (24.14 vs 23.95 °C)
