

Kigali Got Cooler and More Humid, September–October 2026

Name: Mucyo Gad Student ID: 28339 Program: IT

Data and method

I analysed 60 days of Kigali weather (1 September to 30 October 2026) with temperature, rainfall and humidity for each day. I used NumPy arrays, boolean masks and vectorised operations, with no for loops in Parts 3–5.

Overall picture

The mean temperature was **24.00 °C** (minimum 19.3 °C, maximum 28.6 °C, standard deviation 2.61 °C). The hottest day was 17 September at 28.6 °C. There were 16 rainy days with 331.2 mm of rain in total, and the heaviest day had 26.2 mm.

Main insight: a clear cooling trend

The first 30 days averaged 26.21 °C and the last 30 days averaged 21.78 °C, so Kigali became about **4.4 °C cooler**. All 18 hot days (≥ 26 °C, average 27.11 °C) happened in September, as did all 9 days more than 3 °C above the mean. Humidity rose over the same period.

Measure	First 30 days	Last 30 days
Average temperature	26.21 °C	21.78 °C
Hot days (≥ 26 °C)	18	0
Average humidity	about 58%	about 66%
Rain (total)	183.2 mm	148.0 mm

Rain and temperature

Rainy days averaged 24.14 °C and dry days 23.95 °C, so rain and temperature were hardly related in this data. Only 5 days were both hot and rainy. Both halves had 8 rainy days, but the first half was wetter in total.

Limits

This is only 60 days from one season, so the cooling could be short-term variation, not a long-term climate trend. A longer record would be needed to confirm it.
